CS251 Homework 1

Handed out: Feb 20, 2017

Due date: Feb 27, 2017 at 11:59pm (This is a FIRM deadline, solutions will be released

immediately after the deadline)

Question	Topic	Point Value	Score

1. True/False [5 points]

1. Amortized analysis is used to determine the worst case running time of an algorithm.

2. An algorithm using $5n^3 + 12n \log n$ operations is a $\Theta(n \log n)$ algorithm.

3. An array is partially sorted if the number of inversions is linearithmic.

4. Shellsort is an unstable sorting algorithm.

5. Some inputs cause Quicksort to use a quadratic number of compares.

2. Match the columns [7 points]

A. Mergesort O 1. Works well with duplicates

B. Quicksort O O 2. Optimal time and space

C. Shellsort O 3. Works well with order

D. Insertion sort O 4. Not analyzed

E. Selection sort O S. Stable and fast

F. 3-way quicksort O O 6. Optimal data movement

G. Heapsort O 7. Fast general-purpose sort

3. Short Answers [22 points]

(a) Suppose that the running time T(n) of an algorithm on an input of size n satisfies $T(n)=T(\lceil\frac{n}{2}\rceil)+T(\lfloor\frac{n}{2}\rfloor)+c\,n$ for all n > 2, where c is a positive constant. Prove that $T(n)\sim c\,n\log_2 n$. [4 points]

- (b) Rank the following functions in increasing order of their asymptotic complexity class. If some are in the same class indicate so. [4 points]
 - $n \log n$ • $n^2/201$ • n• $\log^7 n$ • $2^{n/2}$ • n(n-1) + 3n
- (c) Consider the following code fragment for an array of integers:

```
int count = 0;
int N = a.length;
Arrays.sort(a);
for (int i = 0; i < N; i++)
  for (int j = i+1; j < N; j++)
    for (int k = j+1; k < N; k++)
    if (a[i] + a[j] + a[k] == 0)
    count++;</pre>
```

Give a formula in tilde notation that expresses its running time as a function of N. If you observe that it takes 500 seconds to run the code for N=200, predict what the running time will be for N=10000. [5 points]

(d) In Project 2 you were asked to use Arrays.sort(Object o) because this sort is stable. What sorting algorithm seen in class is used in this case? What sorting algorithm would you use if instead of dealing with Point objects you were handling float values? Justify your answer. [4 points]

(e) Convert the following (*Infix*) expressions to *Postfix* and *Prefix* expressions (To answer this question you may find helpful to think of an expression "a + b" as the tree below.) [**5 points**]

(i)
$$(a + b) * (c / d)$$

(iii)
$$a + (b * c) / d - e$$

(iv)
$$a * b + c * (d / e)$$

$$(v) a * (b / c) + d / e$$

4. Programming Questions [22 points]

(a) Give the pseudocode to convert a fully parenthesized expression (*i.e.*, an INFIX expression) to a POSTFIX expression and then evaluate the POSTFIX expression. [**5 points**]

(b) Given two sets A and B represented as sorted sequences, give Java code or pseudocode of an efficient algorithm for computing A ⊕ B, which is the set of elements that are in A or B, but not in both. Explain why your method is correct. [5 points]

(c) Let A be an unsorted array of integers $a_0, a_1, a_2, ..., a_{n-1}$. An inversion in A is a pair of indices (i, j) with i < j and $a_i > a_j$. Modify the merge sort algorithm so as to count the total number of inversions in A in time $\mathcal{O}(n \log n)$. [5 points]

(d)Let A [1 . . . n] , B[1 . . .n] be two arrays, each containing n numbers in sorted order. Devise an $\mathcal{O}(\log n)$ algorithm that computes the k-th largest number of the 2n numbers in the union of the two arrays. Do not just give pseudocode — explain your algorithm and analyze its running time.

For full credit propose a solution using constant space. [7 points]

5. Symbol Tables [4 points]

Draw the Red-Black LL BST obtained by inserting following keys in the given order: H O M E W O R K S.
